

S1315F

S1315F Flash-based

Low-Power High-Performance 65 Channel SMD GPS Module

Features

- 65 Channel GPS L1 C/A Code
- Perform 8 million time-frequency hypothesis testing per second
- Open sky hot start 1 sec
- Open sky cold start 29 sec
- Cold start sensitivity -148dBm
- Tracking sensitivity -161dBm
- Multipath detection and suppression
- Accuracy 2.5m CEP
- Maximum update rate 10Hz
- Tracking current ~28mA
- Supports active and passive antenna
- Firmware customizable
- Operating temperature -40 ~ +85°C
- RoHS compliant

Applications

- PND
- MID / Netbook
- Smart-Phone
- Geo-Tagging
- Automatic Vehicle Location
- Personal Tracking

The S1315F is a small form factor GPS module solution intended for a broad range of OEM products, where fast and easy system integration and minimal development risk is required. The user only need to provide DC power of 3.0V ~ 3.6V and GPS signal; the S1315F will output navigation solution in standard NMEA-0183 protocol format.

The S1315F features 65 channel GPS receiver with fast time to first fix and improved -148dBm cold start sensitivity. The superior cold start sensitivity allows it to acquire, track, and get position fix autonomously in difficult weak signal environment. The receiver's -161dBm tracking sensitivity allows continuous position coverage in nearly all application environments. The high performance search engine is capable of testing 8,000,000 time-frequency hypotheses per second, offering industry-leading signal acquisition and TTFF speed.

Measuring 13mm x 15.8mm, the S1315F contains integrated LNA, SAW filter, 0.5ppm TCXO, 65 channel positioning engine, RTC crystal, and low-leakage backup supply LDO regulator. The RF section has cascaded noise figure of 2.3dB, allowing passive antenna operation without extra external LNA.

The receiver is optimized for applications requiring high performance, low power, and low cost; suitable for a wide range of OEM configurations including mobile phone, PND, asset tracking, and vehicle navigation products.

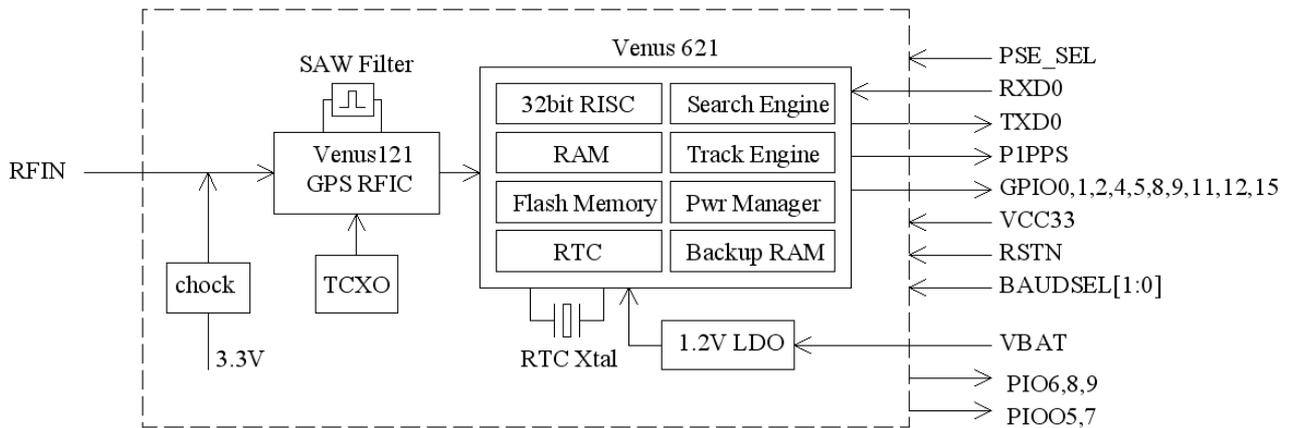

The metal RF shielding provides protection and allows standard surface mount device pick-and-place process in fully automated assembly process; enabling high-volume, very cost-efficient production. The S1315F is available in tape-and-reel form.

BLOCK DIAGRAM

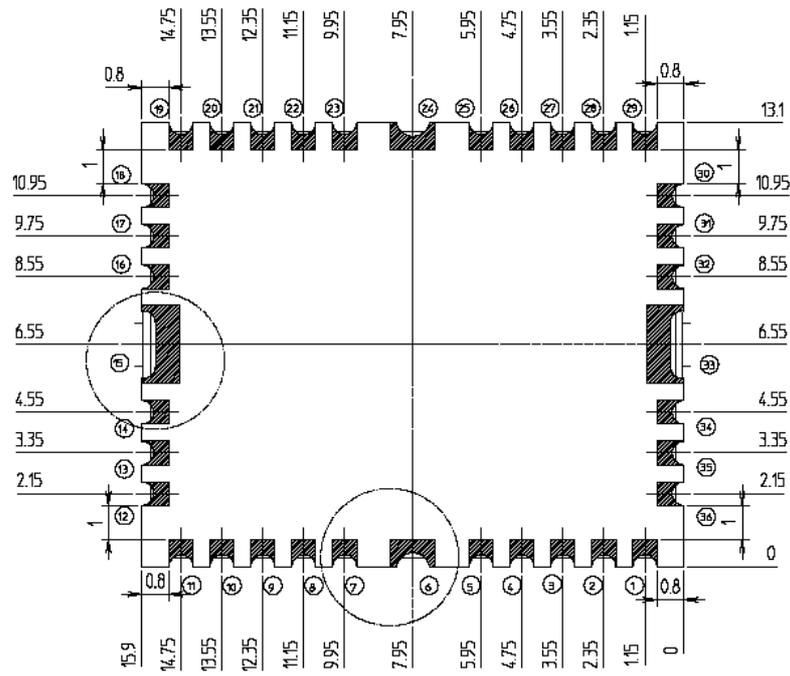

Module block schematic

The S1315F is a high performance GPS receiver in a compact surface mount package. It is based on the SkyTraq Venus 6 positioning technology, providing exceptional signal acquisition performance, and continuous operation even in dense foliage and urban canyons. The module includes internal SAW filter and high performance integrated LNA, works with both active and passive antenna. The simple UART serial interface and the standard NMEA-0183 protocol make using S1315F very easy and straightforward.

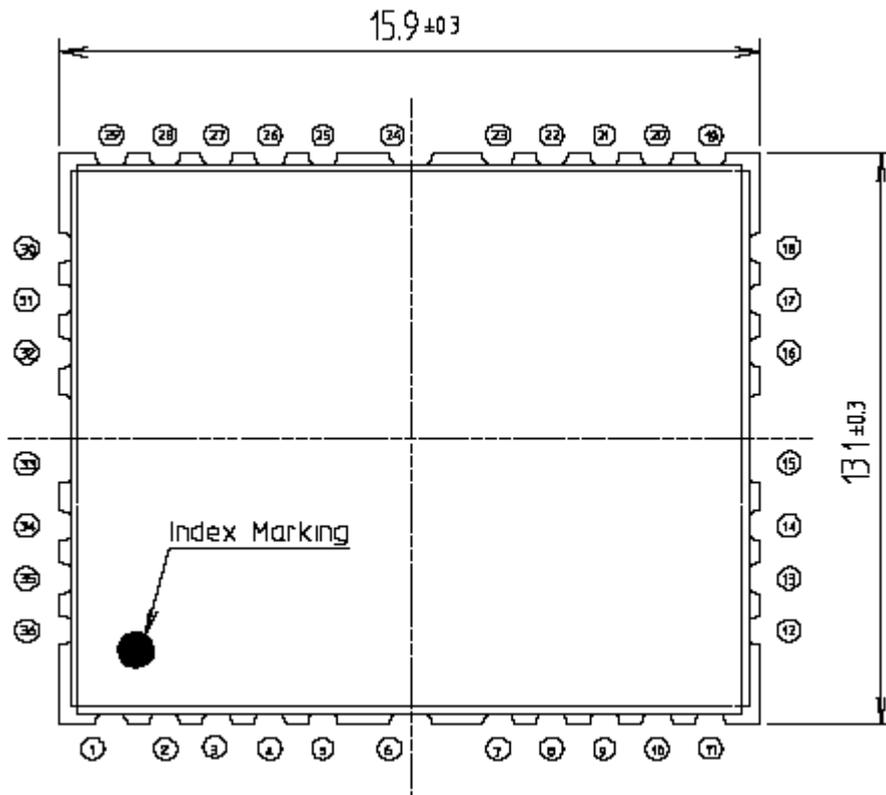

The S1315F performs all the necessary system initialization, satellite signal acquisition & tracking, data demodulation, and calculation of navigation solution autonomously. The position, velocity, time information in NMEA format is generated at user selectable update rate of 1 / 2 / 4 / 5 / 8 / 10 Hz.

PINOUT DESCRIPTION

Pin No.	Name	Description
1	RFIN	GPS RF input, connect to antenna. There is 3V DC bias output for powering active antenna.
2	AGND	Analog Ground
3	AGND	Analog Ground
4	AGND	Analog Ground
5	VBAT	Backup supply voltage for internal RTC and backup SRAM, 1.5V ~ 6V. VBAT must be applied whenever VCC33 is applied. This pin should be powered continuously to minimize the startup time. If VCC33 and VBAT are both removed, all user configurations not set to Flash is lost. For applications the does not care cold starting every time, this pin can be connect to VCC33.
6	GND	Digital ground
7	NC	No connection
8	GPIO2	General purpose I/O, 3.3V LVTTL. Default input mode
9	GPIO1	General purpose I/O, 3.3V LVTTL. Default input mode
10	GPIO11	General purpose I/O, 3.3V LVTTL. Default input mode
11	VCC33	Main power supply, 3.0V ~ 3.6V DC
12	GND	Digital Ground
13	RSTN	External active-low reset input. Only needed when power supply rise time is very slow or software controlled reset is desired.
14	PIO14	PIO, 3.3V LVTTL. Default input mode
15	GND	Digital ground
16	PIO15	PIO, 3.3V LVTTL. Default input mode
17	PIO8	PIO, 3.3V LVTTL. Default input mode
18	GPIO0	GPS fix indicator, active low. Output LOW for no position fix, toggles each second when position fix.
19	PIO6	PIO, 3.3V LVTTL. Default input mode
20	P1PPS	One-pulse-per-second (1PPS) time mark output, 3V LVTTL. The rising edge synchronized to UTC second when getting 3D position fix. The pulse duration is about 4msec at rate of 1 Hz
21	PIO07	Output port, 3.3V LVTTL. Default output LOW
22	PIO9	PIO, 3.3V LVTTL. Default input mode
23	PIO05	Output port, 3.3V LVTTL. Default output LOW
24	GND	Digital ground
25	GPIO15	General purpose I/O pin-15, 3.3V LVTTL. Default input mode
26	GPIO12	General purpose I/O pin-12, 3.3V LVTTL. Default input mode
27	GPIO8	General purpose I/O pin-8, 3.3V LVTTL. Default input mode
28	GPIO5	General purpose I/O pin-5, 3.3V LVTTL. Default input mode
29	GPIO4	General purpose I/O pin-4, 3.3V LVTTL. Default input mode
30	TXD0	UART serial data output, 3V LVTTL. One full-duplex asynchronous serial UART port is implemented. This UART output is normally used for sending position, time and velocity information from the receiver in NMEA-0183 format. When idle, this pin output HIGH.

31	RXD0	UART serial data input, 3V LVTTL. One full-duplex asynchronous serial UART port is implemented. This UART input is normally for sending commands or information to the receiver in SkyTraq binary protocol. In the idle condition, this pin should be driven HIGH. If the driving circuitry is powered independently of S1315F, ensure that this pin is not driven to HIGH when primary power to S1315F is removed, or a 10K-ohm series resistor can be added to minimize leakage current from application to the powered off module.
32	GPIO9	General purpose I/O pin-9, 3.3V LVTTL. Default input mode
33	AGND	Analog ground
34	NC	No connection
35	AGND	Analog Ground
36	AGND	Analog Ground

RECOMMENDED REFLOW PROFILE

The reflow profile shown above should not be exceeded, since excessive temperatures or transport times during reflow can damage the module. Cooling temperature fall rate: max 3°C / sec

ANTENNA CONSIDERATIONS

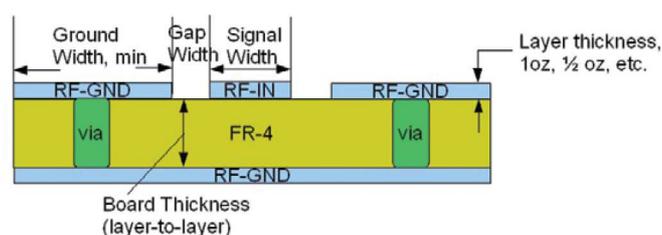

The S1315F is designed to use with a wide variety of active and passive antennas, but care must be taken during antenna selection to ensure optimum signal reception performance. There are many choices of antenna configurations; the best choice is often a tradeoff between size, gain, bandwidth and cost. The best way is to test multiple antenna solutions in the configuration of the final system to determine which provides the best overall performance.

Ceramic patch antenna is low-cost and provides good sensitivity. 50-ohm output ceramic patch antenna can be connected directly to RF input of the module. Usually the antenna and S1315F are mounted on opposite side of the PCB to reduce possibility of picking up digital noise. To improve signal reception performance, use larger ground plane under the patch antenna if possible; larger the ground plane, larger the overall antenna gain. The center frequency of the ceramic patch antenna changes with ground plane size. For optimal operation, center frequency needs to be 1575MHz when mounted on the PCB. It is usual to ask the ceramic patch antenna vendor to select or tune a patch antenna that best matches the customer PCB.

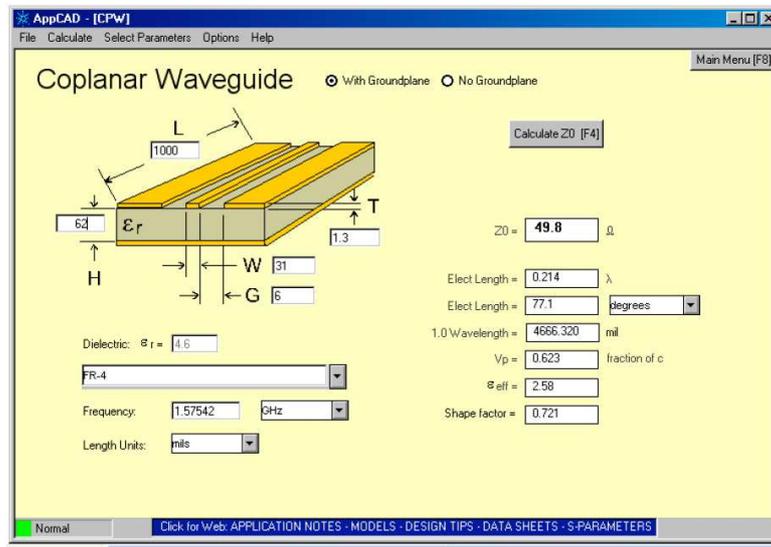

Active antenna is essentially a passive antenna with built-in LNA and a coaxial cable to connect the antenna to the module. It has the flexibility of being located remotely from the module, but requires antenna power. Active antenna usually costs more than passive patch antenna, but the performance in low signal environments is usually better. When using active antenna, an external bias choke inductor is used to provide DC bias for the active antenna. Active antenna with gain up to 30dB and noise figure less than 2dB can be used with S1315F.

Chip antenna is often desired for its small size. Matching element of the chip antenna needs to be designed-in according to the chip antenna datasheet. If application doesn't have a large ground plane as shown in the datasheet for the measured performance spec condition, testing will be needed to determine if it can provide acceptable performance with the smaller sized application PCB.

The signal path from antenna to RF input of S1315F is the most critical part of application design. The goal is to provide optimal 50-ohm match between a 50Ω antenna and the module 50-ohm RF input for maximum power transfer. The 50-ohm grounded coplanar wave guide, consisting of the RF input signal with RF ground on either sides and a RF ground underneath, is a good choice for efficiency.

For a two-layer FR4 PCB design with 1.6mm thickness, 4.6 dielectric constant, and 1oz copper the RF-input trace should be 31mil in width, the gap to the adjacent grounds should be 6mil, and each of the RF grounds should be at least twice the width of the input signal trace (62mil). Freeware program such as AppCAD can be used to calculate values required for other configurations.

POWER SUPPLY REQUIREMENT

S1315F requires a stable power supply, avoid ripple on VCC pin (<50mVpp). Power supply noise can affect the receiver's sensitivity. Bypass capacitors should be placed close to the module VCC33 pin, with values adjusted depending on the amount and type of noise present on the supply line.

BACKUP SUPPLY

The purpose of backup supply voltage pin (VBAT) is to keep the SRAM memory and the RTC powered when the module is powered down. This enables the module to have a faster time-to-first-fix when the module is powered on again. The backup current drain is less than 10 μ A. In normal powered on state, the internal processor access the SRAM and current drain is higher in active mode

1PPS OUTPUT

A 1 pulse per second signal (4ms HIGH duration) is generated on 1PPS pin when the receiver has 3D position fix using 4 or more satellites. The rising edge of the pulse is aligned with UTC second, with accuracy of about 300nsec. It outputs constant LOW when no position fix is available.

LAYOUT GUIDELINES

Separate RF and digital circuits into different PCB regions.

It is necessary to maintain 50-ohm impedance throughout the entire RF signal path. Try keeping the RF signal path as short as possible.

Do not route the RF signal line near noisy sources such as digital signals, oscillators, switching power supplies, or other RF transmitting circuit. Do not route the RF signal under or over any other components (including S1315F), or other signal traces. Do not route the RF signal path on an inner layer of a multi-layer PCB to minimize signal loss.

Avoid sharp bends for RF signal path. Make two 45-deg bends or a circular bend instead of a single 90-degree bend if needed.

Avoid vias with RF signal path whenever possible. Every via adds inductive impedance. Vias are acceptable for connecting the RF grounds between different layers. Each of the module's ground pins should have short trace tying immediately to the ground plane below through a via.

The bypass capacitors should be low ESR ceramic types and located directly adjacent to the pin they are for.

NMEA MESSAGES

The full descriptions of supported NMEA messages are provided at the following paragraphs.

GGA - Global Positioning System Fix Data

Time, position and fix related data for a GPS receiver.
